

Need the “flask_and_jsonify2.py” file (in markers folder) to be running in order for this to run.

Used plotly bubble plot from:
<https://plotly.com/javascript/bubble-maps/>

Still need to get the color inside each bubble to change based on the “depth” of that earthquake.

Also want to get the hover text to change to be something other than “hello” each time. Maybe could display something interesting, like whether there was a tsunami or not, etc.
